Specializing in Restoration and Refinishing for Decks, Fences, etc.

Our Three Step Process:

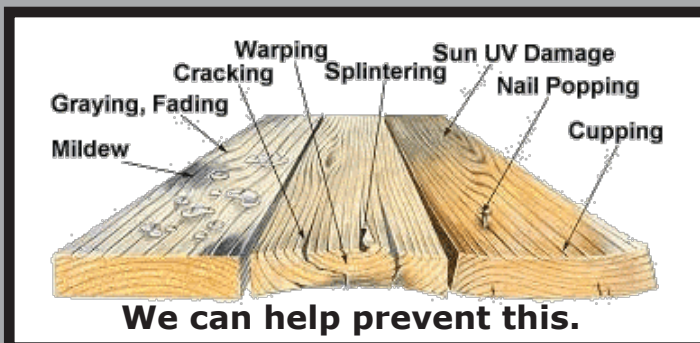

1. Strip/Clean: Wood that has an existing stain will be completely stripped of existing stain. New construction or wood with no existing stain will be cleaned of graying wood, dirt, mold, mildew, etc. (It is recommended new wood ages at least 6 months before it is refinished.)

2. Neutralize and Brighten Wood: The pH of the wood is balanced in this step. This helps the wood readily accept the new stain. The wood is also brightened which helps bring out the visual grain of the wood.

3. Apply Stain: I.V. Clean Team, Inc. uses top quality contractor grade oil-based stains. Two coats are applied to all horizontal surfaces (floors, benches, railings). One coat is applied to vertical surfaces (spindles, posts).

Expectations and Advantages of Our Process:

- Horizontal surfaces will need recoat after 1 to 2 years. Vertical surfaces will need recoat after 2 to 3 years.
- No Intensive stripping required for recoating which results in lower maintenance costs.
- The oil-based stain we use has non-drying conditioning oils. These oils penetrate deep into the wood fibre where the wood's natural oils used to be. This process rejuvenates the wood. Drying oils stay at the surface to lock in the conditioning oils and create a dry to the touch barrier. The stain formulas also contain water repellents and mildicide.
